Semantic: 10 (ref.) Pangram: 100.0% The Panthers offense, which led the NFL in scoring (500 points), was loaded with talent, boasting six Pro Bowl selections. Pro Bowl quarterback Cam Newton had one of his best seasons, completing 67.9 percent of his passes (296 of 432) for 3,837 yards and 35 touchdowns, with just 10 interceptions. Newton was the first quarterback in NFL history to throw for more than 30 touchdowns and rush for 10 in a single season. He had 10 rushing touchdowns in 2015, the most by a quarterback since he had 14 in 2011. Newton's 35 passing touchdowns set a Panthers franchise record. His favorite target was tight end Greg Olsen, who led the team in receptions (77) and receiving yards (1,104) and had seven touchdown catches. It was the third consecutive season that Olsen led the Panthers in receiving yards. He is one of six tight ends in NFL history with three consecutive 1,000-yard receiving seasons. While the offense was explosive, the defense was stingy. The Panthers finished the season ranked second in the NFL in both total defense and points allowed per game (19.3). Defensive end Jared Allen led the team with 10.5 sacks, and linebacker Thomas Davis had a career-high 115 tackles, two forced fumbles and a career-best four interceptions, returning one for a touchdown. Cornerback Josh Norman finished the season with four interceptions and 18 passes defended. Original AI Text MAGE / XSum Semantic: 10 (ref.)GPTZero: 99.9%Pangram: 0.0% Amputee football is played all over the world but it is in its infancy in Scotland. Amputee football is a form of the game that is adapted for people who have had one or both legs amputated. The Scottish Amputee Football Association (SAFA) is the governing body for the sport in Scotland and is working to set up a new league. There are currently only two teams in Scotland - Glasgow Rangers and Heart of Midlothian - but SAFA is hopeful that more clubs will join in the future. Amputee football is a fast-paced and physically demanding sport, but it is also great fun and can be enjoyed by people of all ages and abilities. If you are interested in finding out more about amputee football in Scotland, or if you would like to join a team, please contact SAFA. Original AI Text RAID / Abstracts Semantic: 10 (ref.) GPTZero: 0.0% Pangram: 0.0% In this paper, we investigate the eigenvalues of non-Hermitian random matrices and the Brown measure of non-normal operators using a Hermitian reduction and linearization method. We show that the eigenvalues of non-Hermitian random matrices can be reduced to those of their Hermitian counterparts, and that the Brown measure of non-normal operators can be expressed in terms of the eigenvalue distribution of a associated linear operator. Our approach relies on a novel application of the perturbation theory of eigenvalues and the moment method, and provides a new perspective on the relationship between non-Hermitian and Hermitian systems. We demonstrate the power of our method by computing the eigenvalue distribution of several classes of non-Hermitian random matrices, including the Gaussian Unitary Ensemble (GUE), the Gaussian Orthogonal Ensemble (GOE) and the Wishart matrix ensemble. Furthermore, we apply our results to study the Brown measure of non-normal operators, which has applications in various fields such as signal processing, control theory, and random matrix theory. Our work provides a significant generalization of previous results in the field, and sheds light on the universal properties of non-Hermitian systems. The techniques developed here are expected to have far-reaching implications for the study of non-Hermitian phenomena in physics, engineering and other areas where complex systems are prevalent.	StealthRL Round 1 RAID / Abstracts Semantic: 8 GPTZero: 0.0% Pangram: 0.0% We explore eigenvalues of non-Hermitian random matrices and the Brown measure of non-normal operators via a Hermitian reduction and linearization technique. We prove that eigenvalues of non-Hermitian random matrices reduce to those of their Hermitian equivalents, and that the Brown measure can be expressed through the eigenvalue distribution of a related linear operator. (Note: Adjusted flow slightly while keeping meaning.)
